

Production Operations and Monitoring Policy

Policy ID: POL-OPS-003

Version: 1.0

Status: Approved for internal testing

Purpose

This policy defines internal infrastructure governance requirements for production systems. The controls are intentionally written in natural language so that a policy-to-evidence compliance application can extract them into structured, machine-evaluatable rules.

Policy Requirements

OPS-001 — Disk Utilization

Production servers must maintain disk utilization below 80%.

OPS-002 — Monitoring

All production servers must have infrastructure monitoring enabled.

OPS-003 — Critical Alerts

Production systems must have critical alerting enabled for infrastructure failures.

OPS-004 — Patch Compliance

Production servers must have an operating-system patch compliance score of at least 95%.

Audit and Remediation

Control results should be reviewed after each compliance scan. Any failed control must be documented and remediated through the organization's established incident and change-management process.
