

Production Infrastructure Governance Policy

Policy ID: POL-INFRA-001

Version: 1.0

Status: Approved for internal testing

Purpose

This policy defines internal infrastructure governance requirements for production systems. The controls are intentionally written in natural language so that a policy-to-evidence compliance application can extract them into structured, machine-evaluable rules.

Policy Requirements

INFRA-001 — CPU Utilization

Our production application and database servers must operate with CPU utilization below 85% under normal operating conditions.

INFRA-002 — Auto-Scaling

Our applicable production workloads must have auto-scaling enabled so that additional compute capacity can be provisioned automatically when demand increases.

INFRA-003 — Memory Utilization

Production servers must maintain memory utilization below 90% under normal operating conditions.

INFRA-004 — Environment

Production infrastructure assets must be explicitly identified with the environment value 'production' in platform inventory evidence.

Audit and Remediation

Control results should be reviewed after each compliance scan. Any failed control must be documented and remediated through the organization's established incident and change-management process.
