

Production Infrastructure Security & Operations Policy

Policy ID: AUDITIQ-TEST-001
Version: 1.0
Status: Approved for testing

Purpose

This policy defines infrastructure, monitoring, and security requirements for production systems. The requirements are intended to be evaluated against operational evidence.

Policy Requirements

Control ID	Control	Requirement
AUD-001	Disk Utilization	Production servers must maintain disk utilization below 80%.
AUD-002	Infrastructure Monitoring	All production servers must have infrastructure monitoring enabled.
AUD-003	CPU Utilization	Production application servers must maintain CPU utilization below 85% under normal operating conditions.
AUD-004	Memory Utilization	Production servers must maintain memory utilization below 90% under normal operating conditions.
AUD-005	OS Patch Compliance	Production servers must have an operating-system patch compliance score of at least 95%.
AUD-006	Encryption at Rest	Production databases must have encryption at rest enabled.
AUD-007	TLS Version	Production application endpoints must use TLS version 1.2 or higher.
AUD-008	Public Database Access	Production database servers must not allow direct public network access.
AUD-009	Backup Retention	Production databases must retain automated backups for at least 30 days.

Audit Guidance

Evidence should be evaluated against the semantic meaning of each requirement. Evidence does not need to contain the control ID. A compliance decision should distinguish between compliant evidence, evidence demonstrating a violation, and insufficient evidence.
